

基于GAN的动漫/手绘头像生成

# Motivation

- Transferring selfie to cartoon is very practical, profile in social networks
- The great progress in image stylization
- few techniques focus specifically on selfie cartoonization.

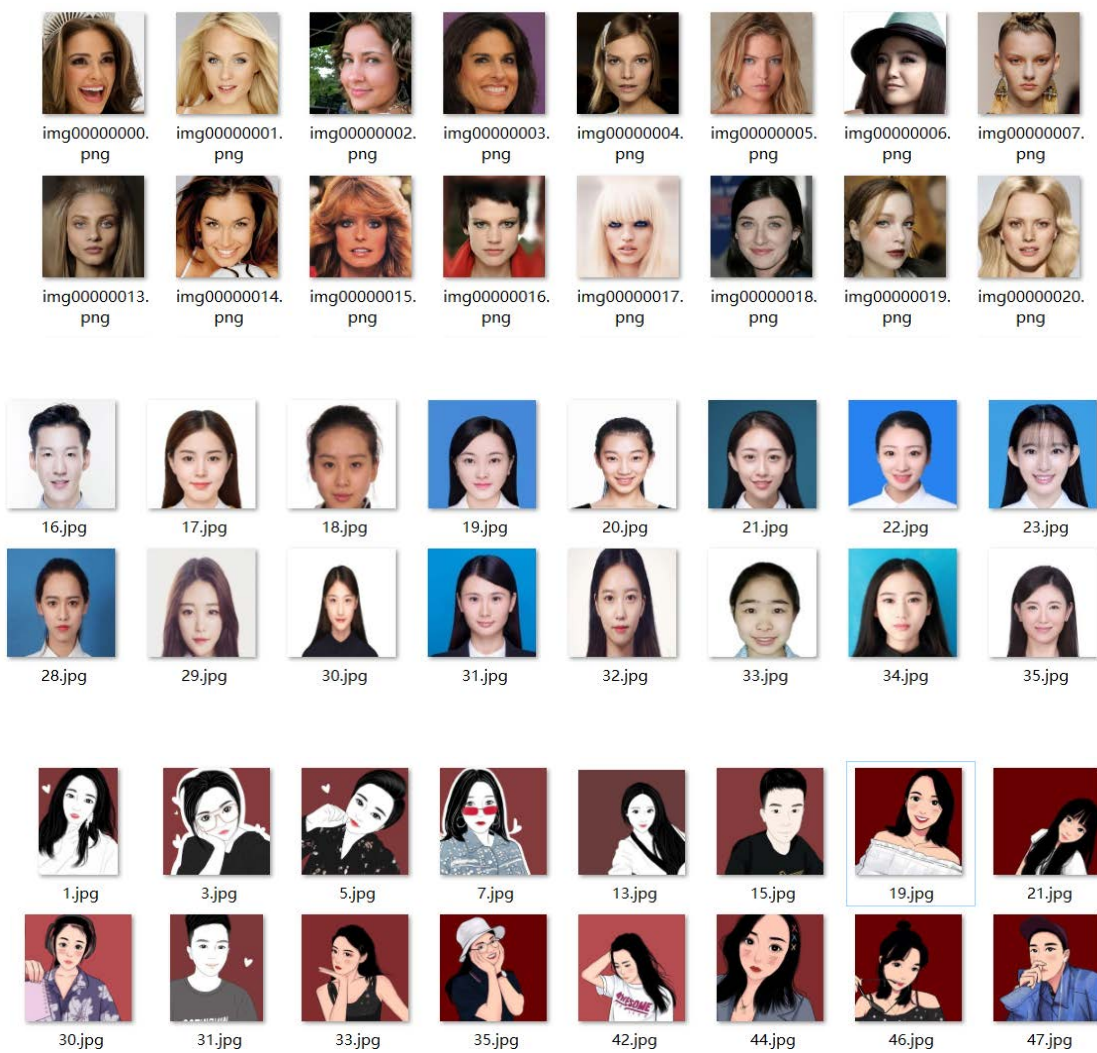

# Dataset

## Sources of Data

- Baidu image
- Google image
- Taobao comments
- celebA

Selfie	Numbers
celebA	350
identification photo	340

Style	Numers
Hand-painted	311

# Results of Existing Methods

Input

Nerual Style Tansfer

pix2pix

CycleGan

CartoonGan

# Problems and Tactics

# Neural Style Transfer(NST)

- Background belongs to style

- Background doesn't belong to style

# CartoonGAN

- Also sees the background as the component of style
- The all face will gradually filled with red background color

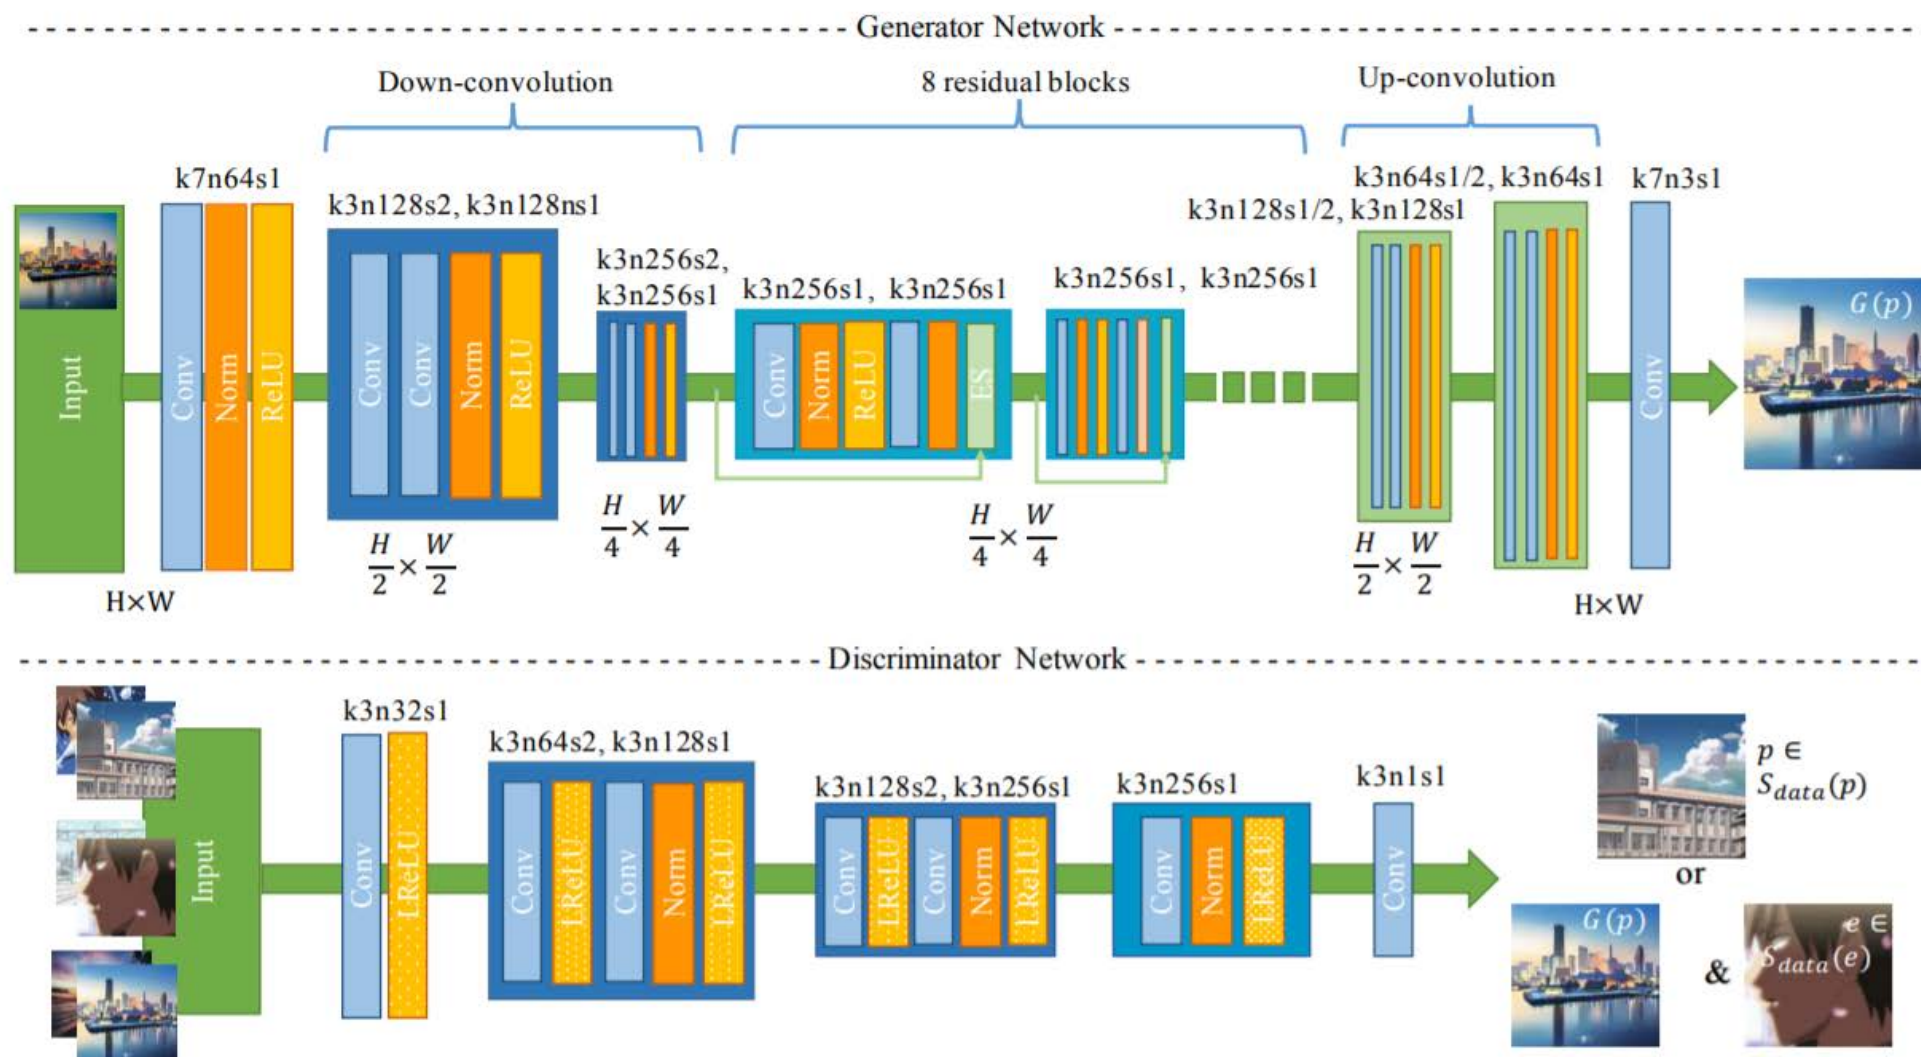

# How to solve this problem?

- Expand the training set, using different backgrounds
- Change model

# Our Model

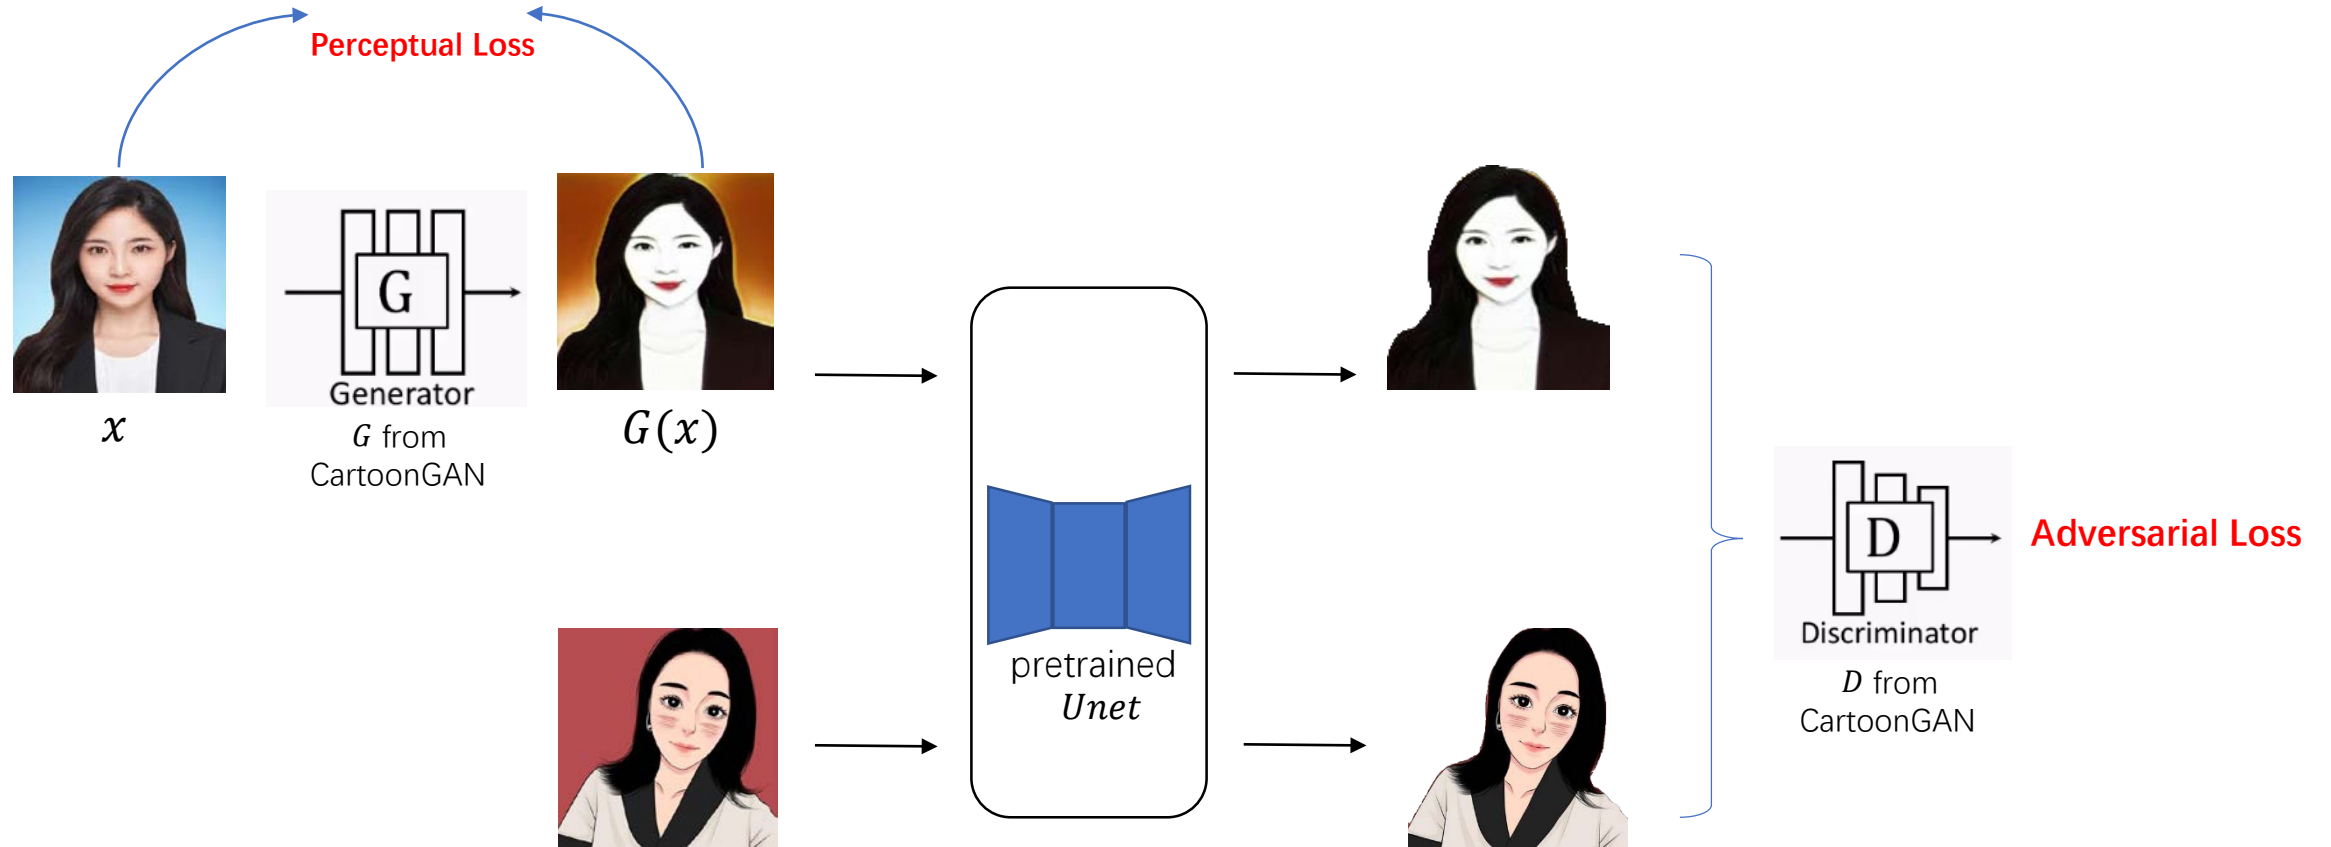

# Based on CartoonGAN

"Cartoongan: Generative adversarial networks for photo cartoonization."

Chen Yang, Yu-Kun Lai, and Yong-Jin Liu. **CVPR 2018**

# Our Model

# Intuition

- use Unet to train a mask model
- Let the discriminator never seen the background.
- If the face of generated image become red, the discriminator will see a incomplete face and judge it a fake image. It will guide the generator to generate good image.

# Loss

- perception loss --- learn content
- adversarial loss --- learn style
- binary\_crossentropy loss --- learn mask, ignore background

1. train G with perception loss 1 epoch
2. train Unet with binary\_crossentropy loss 20 epoch
3. train D and G with adversarial loss 20 epoch

# Learned Mask

# Results

Input

Nerual Style Tansfer

pix2pix

CycleGan

CartoonGan

Our results

# Examples

# Future Work

- Do more experiment to test our model
- make it to be more practical
